

Audit Trail and Logging Policy

Our organization maintains robust audit trails and centralized logging for all material events in production assets. Logs capture authentication attempts, configuration changes, access to sensitive data, and system events. Logging is integrated with monitoring tools that generate alerts for anomalous activity. Access to logs is restricted, tamper-proof, and retained according to compliance requirements. Regular reviews and audits are performed to ensure completeness and integrity of the logging process. This policy ensures compliance with industry best practices and provides visibility into security-relevant events.
