

Monitoring and Alerting Policy

Our organization has implemented continuous monitoring and alerting mechanisms for all production assets. We use automated tools to detect potential threats, unusual activity, and misconfigurations in real-time. Alerts are escalated to our security and engineering teams for immediate triage and response. Logs and alerts are integrated into a centralized monitoring platform to ensure full visibility, fast resolution, and compliance with security best practices. These monitoring practices are aligned with industry standards and are continuously updated to address emerging security risks.
