

Code Review and Approval Policy

Our organization logically enforces the review and approval of code changes before they are deployed to production.

Policy Statement:

- All code changes must go through peer review or automated review workflows before merging into production.
- Reviewers must validate that the code meets security, quality, and functional standards.
- Pull requests cannot be merged without at least one approved review by an authorized team member.

Enforcement:

- GitHub/GitLab branch protection rules are in place to prevent direct commits to production branches without review.
- Automated CI/CD checks must pass before deployment is permitted.
- Code reviews are logged and auditable to maintain accountability.

Comment:

This ensures that all code deployed to production has been reviewed and approved by qualified personnel, reducing the risk of errors and security vulnerabilities.
